

QA engineer - Technical test

Dimitraki Katerina

Part I - UI : Make an analysis of the Ornikar insurance website:

<https://www.ornikar.com/assurance-auto>

1. ANALYSIS

1. In a few words, describe this part of the website and explain its purpose.

The page presents the benefits of having car insurance with Ornikar.

It starts by showing how much money users can save, both for new customers and for people who already did their driving lessons with Ornikar. Then it explains the different insurance plans and what each one covers, so users can understand what fits them best.

There are also several elements that help reassure users. For example, it highlights strong partnerships, offers a free 2-hour driving refresher course for new subscribers, and shows that the subscription process is simple and quick. It also explains that declaring a claim and getting reimbursed is easy, and that in case of an accident, Ornikar takes care of everything.

At the end, the page reassures users even more with customer reviews and by showing that support is available if they have any questions.

Overall, the goal of this page is to convert users into customers, by showing clear benefits and making them feel confident and reassured about choosing Ornikar.

2. STRATEGY

1. Explain what you would test/automate first and why.

I would first test and automate the main CTA buttons that lead users to the next steps, such as the button to start the subscription process, the redirection to the contact form to get an offer by phone, and the login button. These are critical because they directly impact the user's ability to continue in the journey.

Then, I would verify the visibility and correct display of the main reassuring elements, such as the different insurance tiers, the benefits, and the customer reviews section, as they help build trust and support conversion.

Finally, I would check the top banner navigation links (Auto-école, Assurances, Financement) to ensure users can easily access other parts of Ornikar services.

I would prioritize these elements because they have the highest impact on both user experience and business results.

2. Imagine you are with your 3-amigos, please describe the points you will address to explain your tests.

During a 3 Amigos session, I would align with Product and Dev on how the Ornika assurance auto page should behave.

First, I would clarify the main user actions:

- What happens when users click on “Je fais mon devis en ligne”, “Je fais mon devis par téléphone”, and “Connexion”
- Where users are redirected and what the expected outcome is

Then, I would discuss the content:

- Which sections are mandatory (tiers, benefits, reviews)
- Their visibility and order
- Whether the page is different when the user is logged in

I would also cover risks:

- Behavior on desktop and mobile
- What happens if some content doesn't load

Next, I would align on tracking:

- Which actions to track (CTA clicks, navigation)
- How we measure conversion

Finally, I would define the test scope:

- What to automate (main CTAs, redirections, key elements)
- What to test manually (UX, content, visuals)

The goal of this discussion is to ensure everyone has the same understanding of the feature, reduce ambiguities, and identify risks early.

3. Write and explain your testing/automation strategy.

My testing strategy would be risk-based, focusing first on what has the most impact on conversion and user experience.

For this page, I would prioritize the main CTAs, redirections, and the visibility of key elements like tiers, benefits, and reviews. Since it's a landing page, the goal is to guide users and build trust, so anything blocking navigation or reducing clarity is critical.

For automation, I would focus on the most stable and valuable checks:

- main CTA buttons
- redirections
- presence of key sections
- basic smoke checks on desktop and mobile

I would keep UI details, content checks, and exploratory testing manual, as they change more often.

The goal is to have quick feedback on the most important parts while keeping the tests simple and maintainable.

4. Explain what kind of automation framework you like to use and why.

I would use **Nightwatch**, as it is already used in the company. This makes it easier to integrate with the existing setup and collaborate with the team.

It's a good fit for this page because it supports **web and mobile web testing**, as well as **cross-browser testing**, which are important to ensure the page works well for all users.

Overall, I would choose Nightwatch because it covers our needs for testing this page while keeping things simple and consistent with the current stack.

3. AUTOMATION

2. Create an automation report

Part II - API : Make an analysis of the Ornikar insurance API:

<https://insurance-api.ornikar.com>

Endpoints:

- GET /v2/vehicles/suggestions?licensePlate={{LICENCE_PLATE}}
- GET /v2/vehicles/brands
- GET /v2/vehicles/models/?brand={{BRAND}}
- GET /communes/{{ZIP_CODE}}

1. ANALYSIS

1. Explain how you would present to the new product owner what is the API purpose.

This API supports the insurance journey by helping users easily provide their vehicle and location information. Its goal is to simplify the process, reduce manual input, and improve data accuracy.

It is mainly used to pre-fill forms and guide users when entering their car details.

Vehicle-related endpoints:

- `/v2/vehicles/suggestions?licensePlate=...`
Takes a license plate as input and returns detailed vehicle information (brand, model, energy, fiscal power, first registration date) along with possible versions.
Used to automatically identify a car and avoid manual entry.
- `/v2/vehicles/brands`
Returns the list of all available car brands.
Used to populate a dropdown or selection list.
- `/v2/vehicles/models/?brand=...`
Returns all models for a selected brand, with additional details like tax horsepower and energy type.
Used to refine the selection after choosing a brand.

Location endpoint:

- `/communes/{ZIP_CODE}`
Returns the city (commune) associated with a postal code.
Used to validate or auto-fill the user's location.

2. STRATEGY

1. Explain what you would test/automate in this API.

For `/v2/vehicles/suggestions?licensePlate=...`, I would test:

- valid license plates returning the correct vehicle information
- invalid or unknown license plates
- response structure and required fields

For `/v2/vehicles/brands`, I would test:

- that the endpoint returns a list of brands
- that the response is not empty
- that the format is correct

For `/v2/vehicles/models/?brand=...`, I would test:

- valid brands returning the correct models
- invalid or unknown brands
- response structure
- presence of important fields like model name, tax horsepower, and energy

For `/communes/{ZIP_CODE}`, I would test:

- valid zip codes returning the correct commune
- invalid or unknown zip codes
- response format

2. Write and explain your testing/automation strategy.

My strategy would be risk-based and focused on the endpoints that have the biggest impact on the insurance flow.

I would start with the happy paths, to make sure the API returns the expected data for valid inputs. Then I would add negative tests for invalid, missing, or unknown values. In parallel, I would validate the API response schema, to ensure the structure and expected fields remain consistent over time.

For automation, I would prioritize:

- happy path scenarios
- input validation
- response status codes
- response schema and key fields
- a few edge cases

I would keep the automated suite simple and maintainable.

3. AUTOMATION

2. Create an automation report
